SUBJECT: SEWAGE TREATMENT COSTS

The charts you sent are just what we need to help monitor this. I would like to get together and review how the costs are calculated as I have heard several versions on how the breakdown is arrived at. The 1982 figures should help also, but I wouldn't go back any further.

As far as the acidity is concerned, we don't need a chart of the lime equivalents, but may wish to use the data later for our ion exchange justification. I would continue to show the Ph cost as it will get our attention if it goes up.

I suggest the charts be updated - say every quarter and we begin picking out target areas where we can make improvements which will have the greatest impact. I suspect there is a lot we can do with just better practices and common sense.

It might be worthwhile to consider distributing this to some of the key people in technical, maintenance and production areas so they have an understanding of what the consequences of various actions are.

Please include John Sundstrom on the distribution.
